

The Pumping Lemma says that *any “sufficiently long” string in a regular language L can be broken into three parts such that if we “pump” the middle part (repeat it zero or more times) then the result would still belong to L .*

Pumping Lemma: Let L be a regular language. Then there exists a constant p such that for every string w in L , with $|w| \geq p$, we can break w into three parts $w = xyz$ such that

- (1) $y \neq \varepsilon$ (i.e. $|y| > 0$ or $|y| \neq 0$)
- (2) $|xy| \leq p$ (xy cannot occupy more than the first p symbols of w)
- (3) For all $k \geq 0$, the string xy^kz is also in L (i.e. $xy^*z \in L$)

The Pumping Lemma when used to prove that a language L is **not regular** can be viewed as a “game” between a **Prover** and a **Falsifier** as follows:

① **Prover** claims L is regular and fixes the value of the pumping length p .

③ **Prover** writes $w = xyz$ such that $|xy| \leq p$ and $y \neq \varepsilon$.

② **Falsifier** challenges **Prover** and picks a string $w \in L$ of length at least p symbols.

Often, we pick w to be “at the edge” of membership, i.e. as close as possible to failing to be a yes-instance.

④ **Falsifier** wins by finding a value for k such that xy^kz is **not** in L . If it cannot then it fails and **Prover** wins.

The language L is not regular if **Falsifier** can always win this game systematically.

The following are almost complete proofs using the Pumping Lemma (PL). Complete them by filling in the hidden details.

- (1) Show that the language $L = \{a^n b^n \mid n \geq 0\}$ is not regular.

① **Prover** claims L is regular and fixes the value of the pumping length p .

③ **Prover** tries to decompose w into three parts $w = xyz$ but sees that the condition $|xy| \leq p$ forces x and y to only contain the symbol **a**. Furthermore, y cannot just be the empty string because of the condition $y \neq \varepsilon$. Seeing this, the only option available is to have $xy = a^m$ for some $m \geq 1$, and then we get $z = a^{p-m} b^p$.

② **Falsifier** challenges **Prover** and picks $w = a^p b^p \in L$ ($|w| = 2p \geq p$).

④ **Falsifier** now sees that $xy^0z, xy^2z, xy^3z, \dots$ all do not belong to L because they either have less or more **a**'s than there are **b**'s. So, any such string will be enough for **Falsifier** to win the game.

(2) $L = \{ww \mid w \in \{0,1\}^*\}$.

① **Prover** claims L is regular and fixes the value of the pumping length p .

③ **Prover** The PL now guarantees that w can be split into three substrings $w = xyz$ satisfying $|xy| \leq p$ and $y \neq \varepsilon$.

② **Falsifier** challenges **Prover** and chooses $w = (0^p1)(0^p1) \in L$.

This has length

$$|w| = (p+1) + (p+1) = 2p+2 \geq p.$$

④ **Falsifier** Since

$$w = (0^p1)(0^p1) = xyz$$

with $|xy| \leq p$ then we must have that y only contains the symbol 0 .

We can then pump y and produce $xy^2z = xyxz \notin L$ because the first half no longer matches the second half.

So L is not regular.

(3) $L = \{a^i b^j c^k \mid 0 \leq i < j < k\}$

① **Prover** claims L is regular and fixes the value of the pumping length p .

③ **Prover** writes

$$w = (xy)z = (a^p)b^{p+1}c^{p+2}$$

where xy is a string of a 's only

② **Falsifier** challenges **Prover** and chooses

$$w = a^p b^{p+1} c^{p+2}.$$

$$\text{Here } |w| = p + (p+1) + (p+2) \geq p$$

④ **Falsifier** forms

$$xy^2z = a^{p+|y|} b^{p+1} c^{p+2} \notin L$$

because $|y| \geq 1$.

(4) $L = \{a^i b^j \mid i > j\}$

① **Prover** claims L is regular and fixes the value of the pumping length p .

③ **Prover** writes

$$w = (xy)z = (a^p)ab^p$$

i.e. xy is a string of a 's only

② **Falsifier** challenges **Prover** and chooses

$$w = a^{p+1}b^p$$

Here $|w| = (p+1) + p = 2p+1 \geq p$

④ **Falsifier** forms

$$xy^0z = xz = a^{p+1-|y|}b^p \notin L$$

because $|y| \geq 1$. (so $p+1-|y| \leq p$).

(5) $L = \{a^i b^j c^k \mid i > j > k \geq 0\}$

① **Prover** claims L is regular and fixes the value of the pumping length p .

③ **Prover** writes

$$w = a^p a^2 b^{p+1} c^0 = xyz,$$

where xy can have a maximum of p symbols, so xy must be a string of a 's only

② **Falsifier** challenges **Prover** and chooses

$$w = a^{p+2}b^{p+1}c^0.$$

Here $|w| = (p+2) + (p+1) + 0 \geq p$.

④ **Falsifier** forms

$$xy^0z = xz = a^{p+2-|y|}b^{p+1}c^0 \notin L$$

because $|y| \geq 1$.

- (6) **(Minimum pumping length)** The purpose of the following problem is for you to pay close attention to the exact formulation of the Pumping Lemma (PL).

The PL says that every RL has a pumping length p , such that every string in the language can be pumped if it has length p or more.

Note that if p is a pumping length for a language L then so is any other length $\geq p$. We define the *minimum pumping length* for L to be the smallest such p .

For example, if $L = ab^*$ then the minimum pumping length is 2. This is because the string $w = a$ is in L and has length 1, yet w cannot be pumped; but any string in L of length 2 or more contains a b and hence can be pumped by dividing it so that $x = a, y = b$ and z is the rest of the string.

For each of the following languages, give the minimum pumping length and justify your answer.

- 1) aab^*
- 2) a^*b^*
- 3) $aab + a^*b^*$
- 4) $a^*b^+a^+b^* + ba^*$
The notation a^+ is equivalent to aa^* , i.e. 1 or more a 's (as opposed to a^* which means zero or more a 's).
- 5) $(01)^*$
- 6) ε
- 7) $b^*ab^*ab^*$
- 8) $10(11^*0)^*0$
- 9) 1011
- 10) Σ^*

Solution

- 1) $aab^* = \{aa, aab, aab^2, aab^3, aab^4, aab^5, aab^6, \dots\}$, sorted in ascending order with respect to string length.

We notice that aa cannot be pumped (e.g. if we repeat a once then we get aaa which is not in the language), but starting from aab we can pump b to get aab^k for $k = 0, 1, 2, \dots$ which are all in the language, so the pumping length for this language is $p = 3$ (the length of aab , the shortest string that can be pumped).

- 2) $a^*b^* = \{\varepsilon, a, b, a^2, b^2, ab, a^3, b^3, aab, abb, a^4, b^4, \dots\}$

ε is not pump-able, but a or b are, so $p = 1$.

- 3) $aab + a^*b^* = \{aab\} \cup \{\varepsilon, a, b, a^2, b^2, ab, a^3, b^3, aab, abb, a^4, b^4, \dots\}$ which is just $\{\varepsilon, a, b, a^2, b^2, ab, a^3, b^3, aab, abb, a^4, b^4, \dots\} = a^*b^*$ again, so $p = 1$.

$$4) a^*b^+a^+b^* + ba^* = \{ba, aba, bab, bba, aab, \dots\} \cup \{b, ba, ba^2, ba^3, \dots\}$$

This is a union of two languages:

- The RegEx $a^*b^+a^+b^*$ gives $p = 2$ as we can loop a or b from its shortest string $a^0b^1a^1a^0 = ba$.
- The RegEx ba^* also gives $p = 2$ as we can loop a from its second shortest string ba .

So, we conclude that the given language has $p = 2$ (the shortest of the two lengths, which happen to be the same in this example).

$$5) (01)^* = \{\varepsilon, 01, 0101, 010101, (01)^4, (01)^5, \dots\}$$

So starting from 01 we can set $x = z = \varepsilon$ and $y = 01$ in the Pumping Lemma. Hence, $p = 2$, the length of 01.

$$6) \varepsilon$$

This RegEx represents the language that only contains the empty string: $\{\varepsilon\}$. There is no way of writing $\varepsilon = xyz$ with $y \neq \varepsilon$, so it suffices to let $p = 1$. The language is finite (and therefore regular), and there are no pump-able strings!

Note: ε is the only possible string of length zero over any alphabet, and it is not pump-able in any language, so p is always ≥ 1 , unless the language is the empty language \emptyset .

$$7) b^*ab^*ab^* = \{aa, baa, aba, aab, b^2aa, ab^2a, aab^2, baba, baab, abab, \dots\}$$

Here, $b^0ab^0ab^0 = aa$ is not pump-able (if pumped then it would produce aa^+ which is not of the required form $b^*ab^*ab^*$).

However, all the strings of length 3 are pump-able producing e.g. b^*aa from baa . So $p = 3$.

$$8) 10(11^*0)^*0 = \{100, 10100, 101100, 1011100, 1010100, \dots\}$$

$100 = 10(11^*0)^00$ is not pump-able, but $10100 = 10(11^00)^10$ is pump-able producing $10100 = 10(10)^*0$, so $p = 5$.

$$9) 1011$$

This RegEx represents the language that only contains one string: $\{1011\}$. If we pump any symbol then the length of the resulting string will be at least 5, so it cannot be a member of this language. Hence, it suffices to let $p = 5$. The language is finite (and therefore regular), and there are no pump-able strings!

$$10) \Sigma^* = \{\varepsilon, \dots\} \text{ is the language of all possible strings over the alphabet } \Sigma.$$

In particular, if a is a symbol then a^* is also in Σ^* , so $p = 1$.

- (7) **(Pumping lemma applied to RLs)** When we try to apply the Pumping Lemma to a Regular Language the **Prover** wins, and the **Falsifier** loses.

Show why **Falsifier** loses when L is one of the following RLs:

- 1) $\{00, 11\}$
- 2) $(aa + bb)^*$
- 3) 01^*0^*1
- 4) \emptyset

Solution

- 1) $\{00, 11\}$

This is a finite language, so **Prover** chooses $p = 3$. **Falsifier** cannot choose a string that is long enough. ($|w| \geq 3$ but the two available strings are only 2 symbols long.)

- 2) $(aa + bb)^*$

Prover chooses $p = 2$ and $y = aa$ or bb , depending on the string chosen by the **Falsifier**.

- 3) 01^*0^*1

Prover chooses $p = 3$ and $y = 0$ or 1 , depending on the string chosen by the **Falsifier**.

- 4) \emptyset

Falsifier has no strings to choose from! (**Prover** may set $p = 0$ or any other value.)

Go through the JFLAP tutorial on: <http://www.jflap.org/tutorial/pumpinglemma/regular/> and then try all the “games.”

JFLAP plays the role of **Falsifier** and you play the role of **Prover**.

Note that *some of the languages below are actually regular* – in this case, you will need to devise a strategy for **Prover** to always win no matter what **Falsifier** chooses as a challenge string.

JFLAP’s notation:

- m is used instead of p (the pumping length).
- i is used instead of k in xy^kz .
- $n_a(w)$: the number of occurrence of the symbol a in the string w .
e.g. $n_a(aba) = 2$ and $n_b(aba) = 1$.
- w^R : the reverse string of w , e.g. $abb^R = bba$.

Assume $\Sigma = \{a, b\}$ unless otherwise specified.

The list of languages is as follows:

1. $\{a^n b^n \mid n \geq 0\}$ Hint: $a^p b^p$
2. $\{w \in \Sigma^* \mid n_a(w) < n_b(w)\}$ Hint: $a^p b^{p+1}$
i.e. language of strings which have less a’s than there are b’s.
3. $\{ww^R \mid w \in \Sigma^*\}$ Hint: $a^p b^{2p} a^p$
4. $\{(ab)^n a^m \mid n > m \geq 0\}$ Hint: $(ab)^{p+1} a^p$
5. $\{a^n b^m c^{n+m} \mid n \geq 0, m \geq 0\}$
6. $\{a^n b^\ell a^k \mid n > 5, \ell > 3, \ell \geq k\}$ Hint: Regular
7. $\{a^n \mid n \text{ is even}\}$ Hint: Regular
8. $\{a^n b^m \mid n \text{ is odd or } m \text{ is even}\}$ Hint: Regular
9. $\{bba(ba)^n a^{n-1} \mid n \geq 1\}$
10. $\{b^5 w \mid w \in \Sigma^* \text{ and } 2n_a(w) = 3n_b(w)\}$
11. $\{b^5 w \mid w \in \Sigma^* \text{ and } n_a(w) + n_b(w) \equiv 0 \pmod{3}\}$
12. $\{b^m (ab)^n (ba)^n \mid m \geq 4, n \geq 1\}$
13. $\{(ab)^{2n} \mid n \geq 1\}$ Hint: Regular

Warning: The games played by JFLAP are for a specific challenge string. This is only meant to give you a feel for how the general game proceeds. When we write our proofs we are not allowed to choose a fixed value for p .

- (1) Let $\Sigma = \{0, 1, +, =\}$, and ADD be the language given by

$\{u=v+w \mid u, v, w \text{ are binary integers, and } u \text{ is the sum of } v \text{ and } w \text{ in the usual sense}\}$

Show that ADD is not regular.

Solution

① **Prover** claims L is regular and fixes the value of the pumping length p .

③ **Prover** can only have 1's in y , so $y = 1^d$ for some $d \geq 1$

② **Falsifier** challenges **Prover** and chooses w to be $1^p = 0^p + 1^p$

④ **Falsifier** constructs $xyyz$ and finds it to be

$$1^{p+d} = 0^p + 1^p$$

which is not correct.

- (2) Let $L = \{1^{2^n} \mid n \geq 0\}$. Show that L cannot be regular.

Solution

① **Prover** claims L is regular and fixes the value of the pumping length p .

③ **Prover** writes

$$x = 1^a, y = 1^b, z = 1^{2^p - a - b}$$

where $1 \leq b \leq p$.

② **Falsifier** challenges **Prover** and $w = 1^{2^p}$

④ **Falsifier**

$$xyyz = 1^{2^p + b}$$

The next string after 1^{p^2} in terms of length is $1^{2^{p+1}} = 1^{2^p + 2^p}$ but

$$2^p < 2^p + b < 2^p + 2^p.$$

because

$$1 \leq b \leq p < 2^p$$

So $xyyz \notin L$.

- (3) $L = \{a^i b^j c^k \mid j \neq i \text{ or } j \neq k\}$

❶ **Prover** claims L is regular and fixes the value of the pumping length p .

❸ **Prover** writes

$$w = (xy)z = (a^p)b^{p!+p}c^{p!+p}$$

where xy is a string of a's only

❷ **Falsifier** challenges **Prover** and chooses

$$w = a^p b^{p!+p} c^{p!+p}$$

Here $|w| = p + 2(p! + p) \geq p$.

❹ **Falsifier** forms

$$xy^k z = a^{p+(k-1)|y|} b^{p!+p} c^{p!+p}$$

where $k = 1 + \frac{p!}{|y|}$. This gives

$a^{p!+p} b^{p!+p} c^{p!+p}$ which is not in the language.
